HOLY ANGEL UNIVERSITY

Name: Ong, Sean Keiffer S. **Date:** September 20, 2026

Section: CS-302 **Course:** Computer Science

Final Project Mockup

A. Login Screen

What the user does here

The user can use the app either as a registered user or as a guest, a registered account requires the user to input the necessary credentials while a guest can proceed without any inputs.

Where each tappable thing goes

1. **Sign In**

- Navigates to Map interface as a registered user

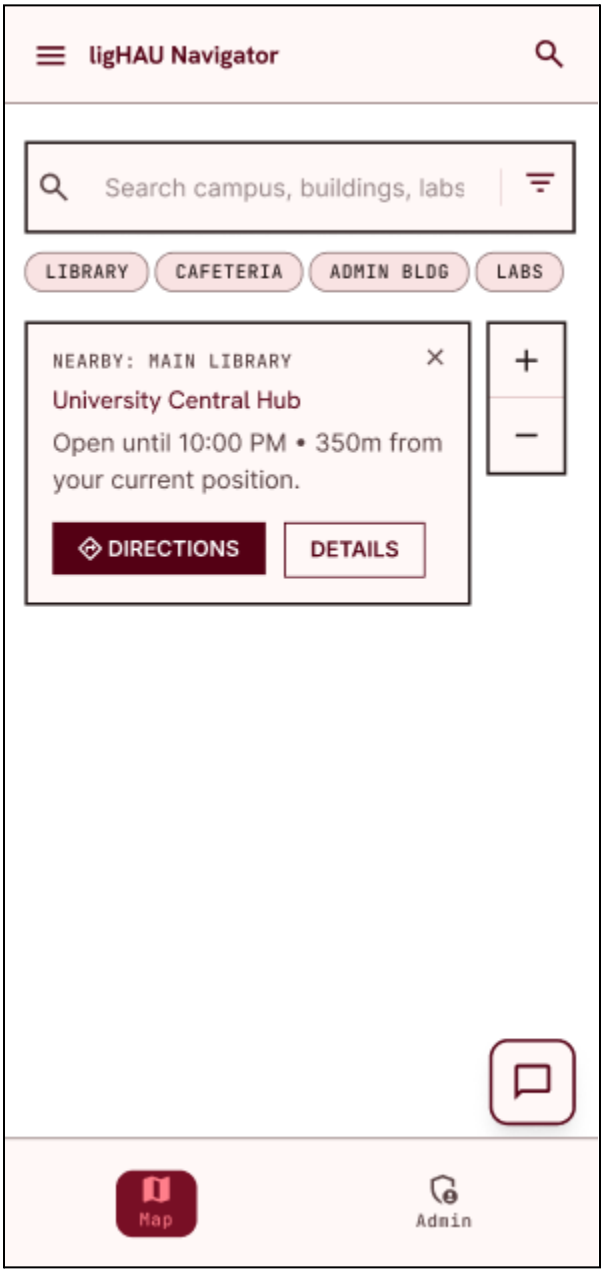

2. Continue as guest

- Navigates to Map interface as a guest

3. Admin Credentials

- Gain access to admin dashboard upon entering the registered admin credentials

B. Map Interface

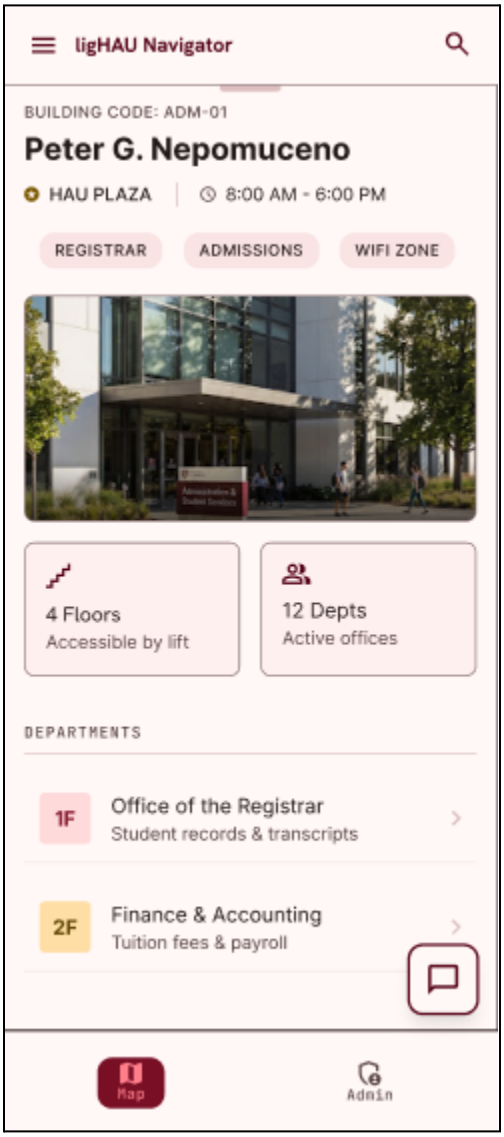

What the user does here

The user is now on the main state of the application which is the map interface, the user can navigate the campus using the 2D interactive map, while having access to content filters, search functions, and chatbot interaction.

Where each tappable thing goes

1. **Search Bar**
    - Navigates to search pane
2. **Filter chips (Library, Cafeteria, Admin Building, Labs, etc.)**
    - Output related places according to selected chip, no navigation
3. **Directions**
    - Output building directions, navigates to building information pane
4. **Details**
    - Output building details, navigates to building information pane
5. **Zoom Buttons (+/-)**
    - Zooms the map according to user input, no navigation
6. **Chatbot Button**
    - Navigates to chatbot pane

C. Building Information Pane

What the user does

After searching for a specific building, the user can see the information regarding that selected building which includes amenities, departments, building data, directions, schedule, and etc…

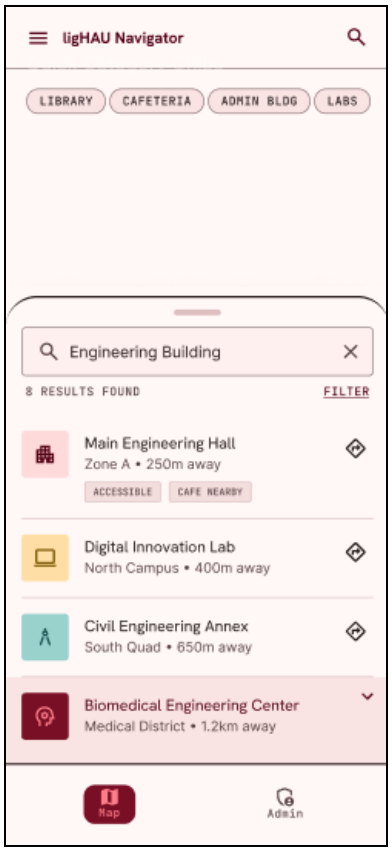

Where each tappable thing goes

1. **Dragging Bar**

- Navigates to map interface, when the bar is dragged down

2. **Chatbot Button**
    - Navigates to chatbot pane

D. Search Pane

What the user does

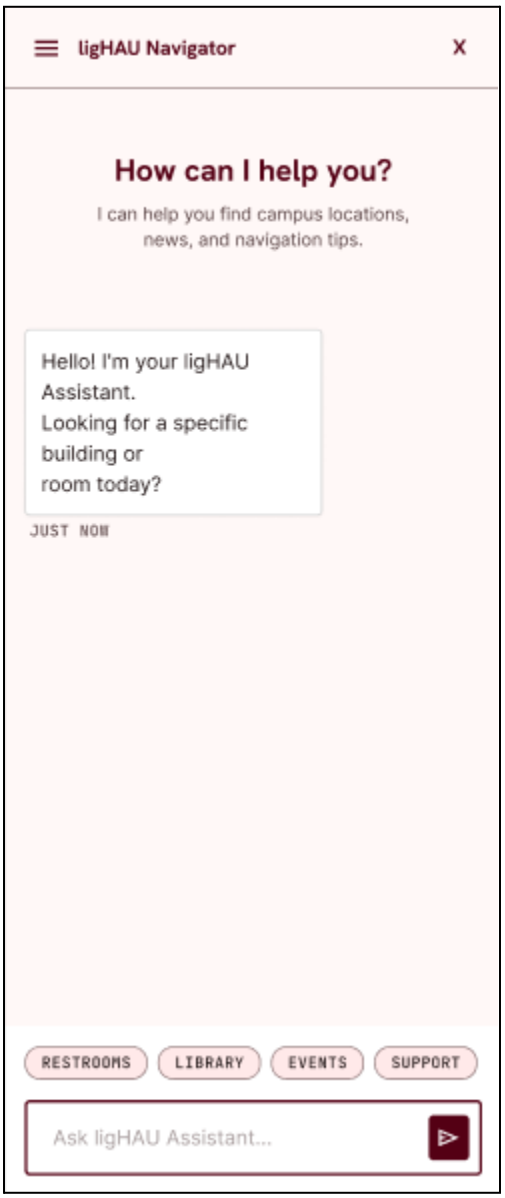

The user can search campus buildings through keywords, and filter chips

Where each tappable thing goes

1. **Filter chips (Library, Cafeteria, Admin Building, Labs, etc.)**
    - Output related places according to selected chip, no navigation
2. **Search Bar**
    - Output related places according to the keyword input, no navigation
3. **Building Name**

- Displays that building's output through the building information pane, navigates to building information pane

E. Chatbot Pane

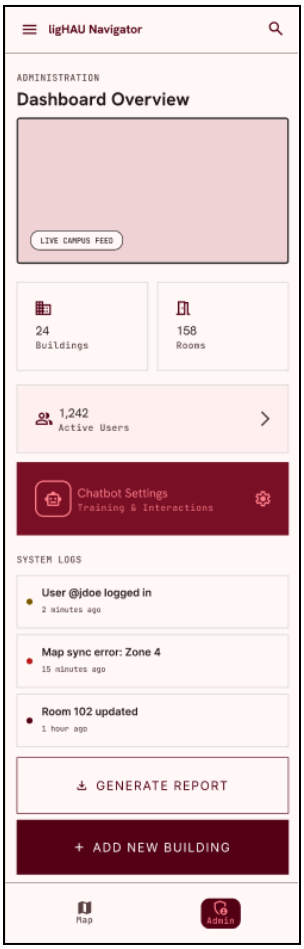

What the user does

The user can use the chatbot to prompt questions/queries regarding the campus, the chatbot can suggest, display, and guide users.

Where each tappable thing goes

1. **Message Box**
    - The user inputs and sends the prompt through the message box, no navigation
2. **Filter Chips (Restrooms, Library, Events, Support, etc…)**
    - The chatbot produces output related to the selected filter chip, no navigation
3. **Close Button**
    - Returns to map interface, navigates to map interface

F. Admin Dashboard

What the user does

The admin can monitor users, buildings, and other system related information through this dashboard. The admin also has access to CRUD operations when altering data inside the application.

Where each tappable thing goes

1. **Registered Users**
    - Shows all the registered users inside the application, no navigation
2. **Chatbot Settings**
    - Shows chatbot information regarding interactions, configurations, and training. No navigation
3. **Generate Report**
    - Generates a comprehensive report regarding updates/changes made in the application, no navigation
4. **Add new building**
    - Adds a new building according to the admin input, no navigation

What changed, and why

Screen	The wireframe assumed	The mockup shows	What I will cha
Login Screen	A basic login screen mainly for registered users entering credentials before accessing the application.	The login now supports registered users, guest access, and administrator access. Registered users sign in normally, guests can continue without credentials, and valid admin credentials provide access to the Admin Dashboard.	Update the login flow to clearly support Sign In and Continue as Guest, while using administrator credentials to route authorized admins to the Admin Dashboard.
Map Interface	A general campus map where users could view buildings	The map is now the application's main state, with a 2D	Keep the map as the central screen and connect its controls to

	and access basic navigation features.	interactive campus map, search, category filter chips, zoom controls, building selection, details/directions actions, and chatbot access.	the appropriate panes. Keep zoom and filters as same-screen interactions, while Search, Building Information, and Chatbot open their respective panes.
Building Information Pane	A simple view showing basic information about a selected campus building.	The pane contains more detailed building information such as amenities, departments, building data, directions, schedules, facilities, accessibility, restrooms, and operating hours while keeping the map visible.	Expand the building data displayed and use the pane as the primary destination after a building or search result is selected. Allow users to close/drag the pane down to return to the Map Interface.
Search Pane	A dedicated search pane where users could search for campus buildings and locations.	The Search Pane now shows a clearer search flow with keyword input, category filter chips, matching location results, and selectable building names that open the Building Information Pane.	Keep the Search Pane from the original design, but refine its functionality by adding filter chips, structured search results, and a clear connection between selected results and the Building Information Pane.
Chatbot Pane	The chatbot was treated as a general assistant feature with limited interaction defined in the initial wireframe.	The chatbot has its own pane where users can enter questions or use quick filters such as Restrooms, Library, Events, and Support. It can suggest locations and direct users toward building information.	Implement the chatbot as a pane over the map. Messages and filter chips will update the conversation without changing screens, while suggested locations can lead to the Building Information Pane.

Admin Dashboard	A basic administration screen for viewing and managing application information.	The dashboard now includes registered-user monitoring, building management, chatbot settings, reports, application statistics, and CRUD operations for campus data.	Expand the Admin Dashboard into the application's management area. Admin actions such as viewing users, configuring the chatbot, generating reports, and adding/updating buildings will occur inside the dashboard, with Logout returning to the Login Screen.
